How to Install XAMPP on your Ubuntu 18.04 LTS System

XAMPP stands for cross-platform(X), Apache(A) server, MariaDB(M), PHP(P) and Perl(P). It is built by Apache Friends and basically serves as a local host or a local server. Through this local server, you can install this software on your system and test the clients or your website before uploading it to the remote web server or computer. XAMPP is most widely known by Windows users, but there are XAMPP packages for Ubuntu Linux as well. In this article, we will describe a step-by-step method for installing this application stack on your system. You can then verify the installation by using a few URLs. You can also go through the uninstall process that will help you in uninstalling the software if the need arises.

The commands and procedures described in this article have been run on an Ubuntu 18.04 LTS system.

Installing XAMPP on Ubuntu 18.04

Click on the XAMPP for Linux option after which you will be prompted to Run the package or Save it to your system. We recommend downloading the package by clicking the Save File option. After which, your downloaded file will be saved to the Downloads folder by default.

Step 2: Make the installation package executable

We will install the package through the Ubuntu command line, The Terminal. In order to open the Terminal, either use the Dash or the *Ctrl+Alt+T* shortcut. After the Terminal is open, you need to move to your Downloads folder to access the file.

Move to the Downloads folder by using the following command:

```
$ cd /home/[username]/Downloads
```

The installation package you downloaded needs to be made executable before it can be used further. Run the following command for this purpose:

```
$ chmod 755 [package name]
```

Example:

```
$ chmod 755 xampp-linux-x64-7.2.10-0-installer.run
```

How to Install VirtualBox on Ubuntu 18.04 LTS

posted on November 5, 2018 | under [Desktop](#), [Linux](#), [Shell](#), [Ubuntu](#)

```
File Edit View Search Terminal Help
sana@linux:~$ cd /home/sana/Downloads
sana@linux:~/Downloads$ chmod 755 xampp-linux-x64-7.2.10-0-installer.run
sana@linux:~/Downloads$
```

Now the install package is in an executable form.

Step 3: Confirm execute permission

It is important to verify if the package can be executed by the current user. The execute permission can be checked through the following command:

```
$ ls -l [package name]
```

Example:

```
$ ls -l xampp-linux-x64-7.2.10-0-installer.run
```

```
sana@linux:~/Downloads$ ls -l xampp-linux-x64-7.2.10-0-installer.run
-rwxr-xr-x 1 sana sana 140842519 Oct  1 09:33 xampp-linux-x64-7.2.10-0-installer
.run
```

The -rwxr output shows that the file can be executed by the user whose name is also mentioned in the output.

Step 4: Launch the Setup Wizard

As a privileged root user, run the following command in order to launch the graphical setup wizard.

```
$ sudo ./[package name]
```

Example:

```
sudo ./xampp-linux-7.2.10-0-installer.run
```

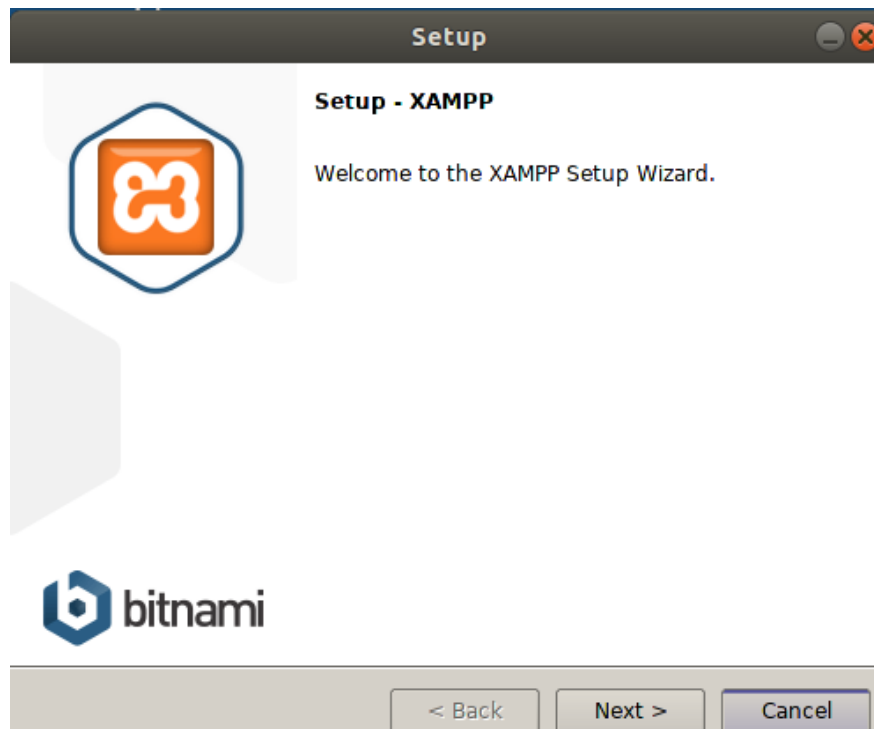

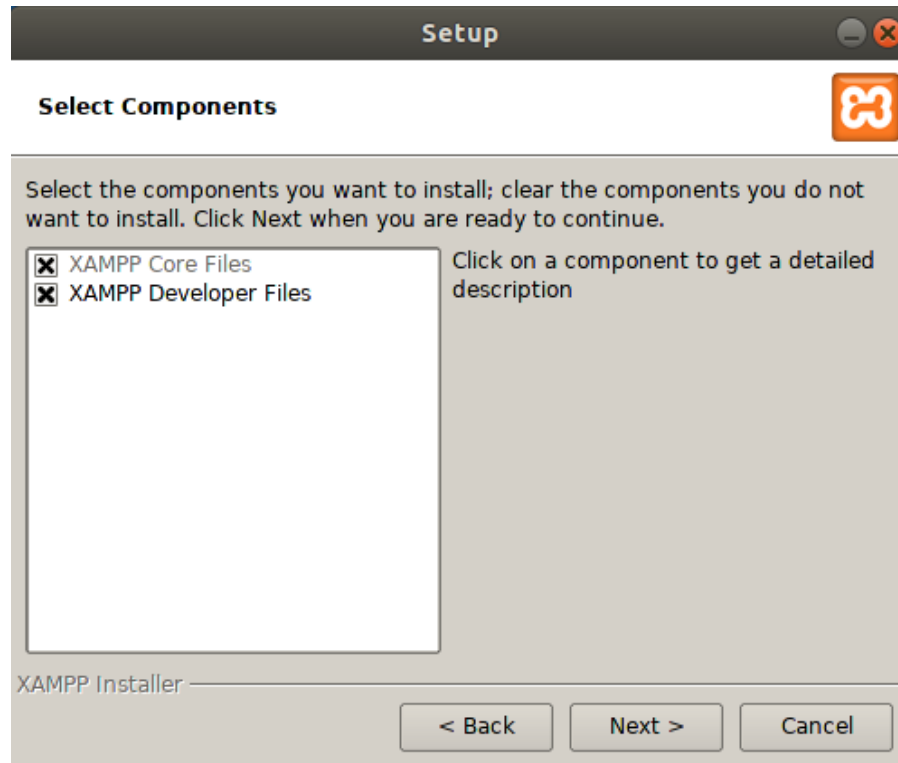

This will launch the Setup wizard that will direct you with the rest of the installation procedure.

Step 5: Work through the graphical setup wizard

Now that the Setup Wizard for XAMPP by Bitnami is launched as follows, click the Next button to start the installation process:

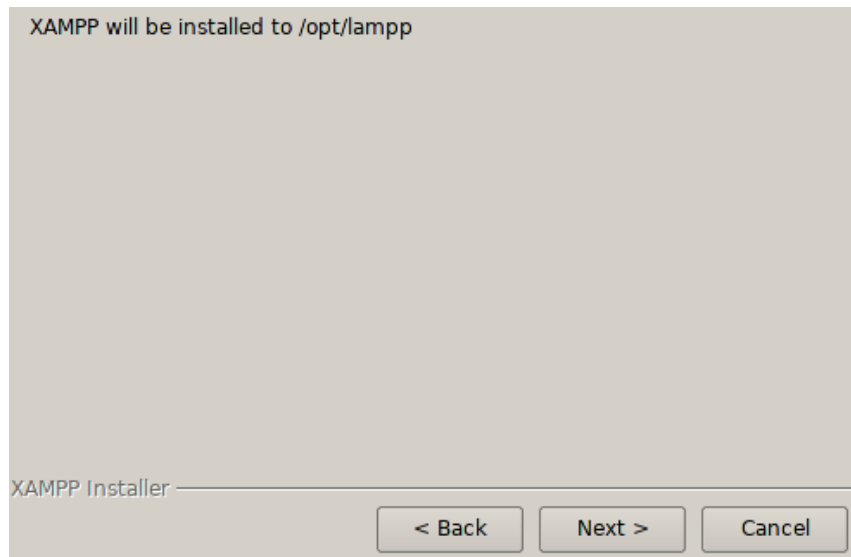

The following dialog lets you choose XAMPP components that you want to install.

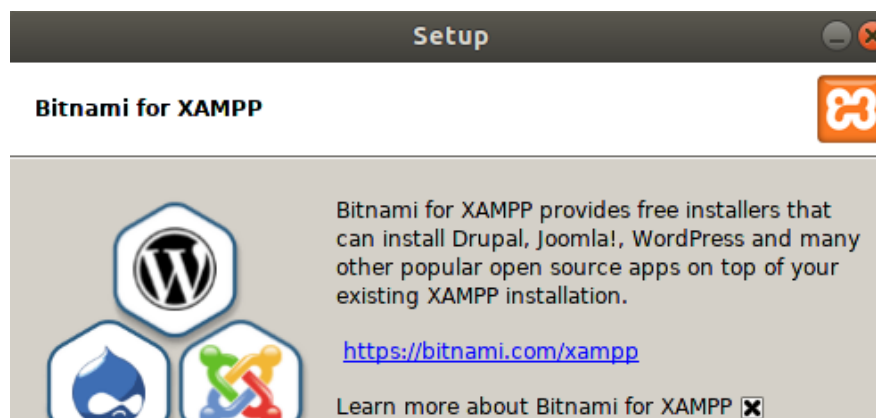

Keep the default settings intact and then click *Next*. The following dialog will inform you about the location where XAMPP will be installed.

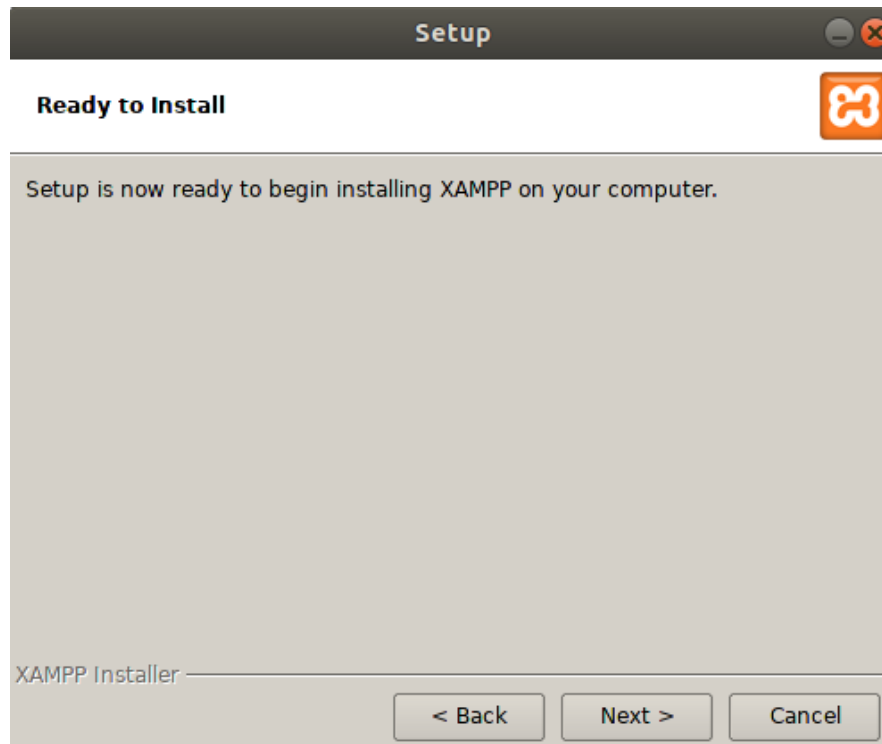

Click *Next* to continue. The following dialog gives you the option of installing sponsored applications such as Drupal, Joomla!, and WordPress etc. You can avoid Bitnami to install these applications by unchecking the 'Learn more about Bitnami for XAMPP' checkbox.

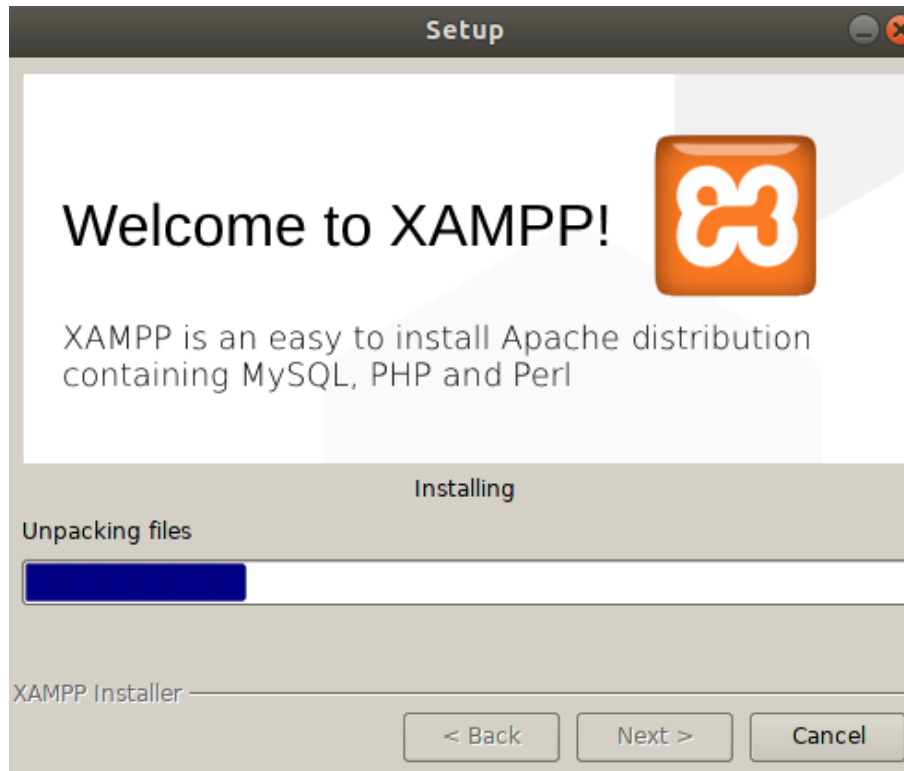

Click the *Next* button after which the following dialog will appear:

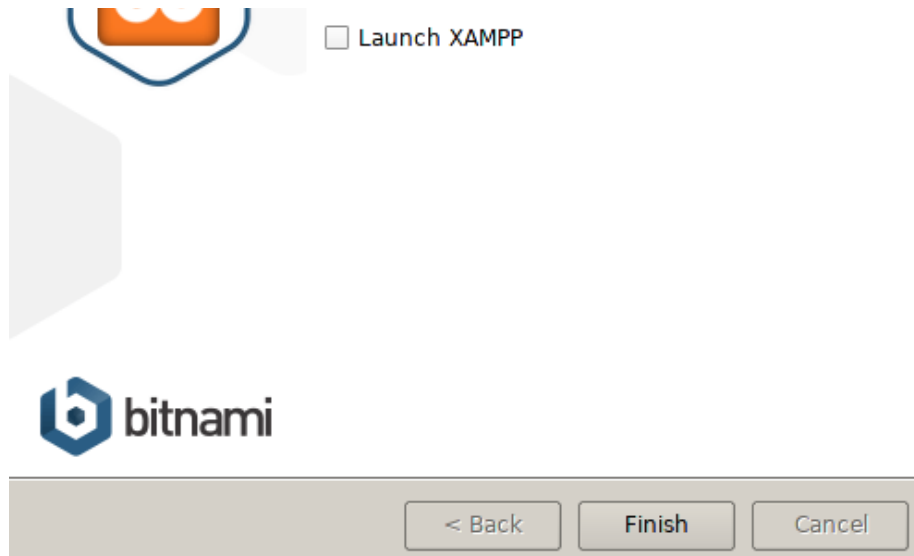

Click Next to begin the installation process:

When the installation is complete, click the Next button. The following dialog indicates the completion of the installation process.

If you do not want to Launch XAMPP at this moment, uncheck the Launch XAMPP option. Also, click Finish to close the Setup dialog.

Step 6: Launch XAMPP through the Terminal

In order to launch XAMPP through your Ubuntu Terminal, enter the following command as root:

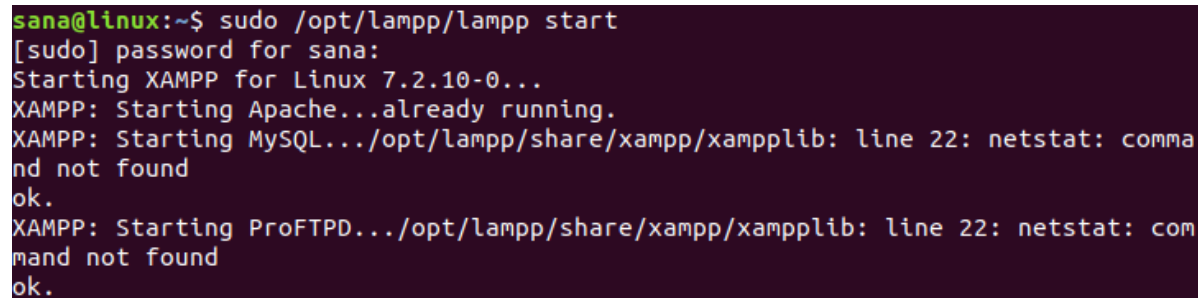

```
$ sudo /opt/lampp/lampp start
```

```
File Edit View Search Terminal Help
sana@linux:~$ sudo /opt/lampp/lampp start
Starting XAMPP for Linux 7.2.10-0...
XAMPP: Starting Apache...already running.
XAMPP: Starting MySQL...already running.
XAMPP: Starting ProFTPD...already running.
```

A terminal window showing the command 'sana@linux:~\$ sudo /opt/lampp/lampp start' and its output. The output indicates that XAMPP is starting, Apache is already running, and MySQL is starting. It also shows error messages for 'netstat' command not found when starting MySQL and ProFTPD.

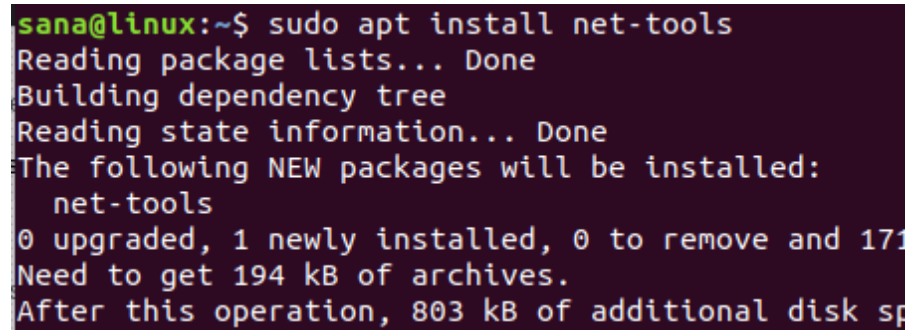

This output shows that XAMPP is started and already running. Please note that you need to manually start XAMPP each time you restart your system.

If you get the following output after starting XAMPP, it means that Net Tools are not installed on your system:

A terminal window showing the command 'sana@linux:~\$ sudo /opt/lampp/lampp start' and its output. The output indicates that XAMPP is starting, Apache is already running, and MySQL is starting. It also shows error messages for 'netstat' command not found when starting MySQL and ProFTPD.

In order to install Net Tools, run the following command as root:

```
$ sudo apt install net-tools
```

A terminal window showing the command 'sana@linux:~\$ sudo apt install net-tools' and its output. The output shows the package lists being read, the dependency tree being built, and the state information being read. It then lists the new packages to be installed (net-tools) and shows the disk space requirements.

```
Get:1 http://pk.archive.ubuntu.com/ubuntu bionic/universe amd64 git20161116.90da8a0-1ubuntu1 [194 kB]
Extracting 194 kB in 1s (175 kB/s)
```

After the installation of Net Tools, you will be successfully able to launch and use XAMPP.

Step 7: Verify Installation

After you have installed XAMPP on your Ubuntu system, it is good practice to verify the installation. To do so, enter the following URL in your FireFox browser:

```
http://localhost
```

The following webpage verifies that XAMPP is successfully installed and running on your system:

You can also verify the installation of phpMyAdmin in a similar manner by entering the following URL in your browser:

```
http://localhost/phpmyadmin
```

The following webpage verifies that phpMyAdmin is successfully installed and running on your system:

Uninstall XAMPP

It is also important to learn how to completely uninstall and remove XAMPP from your Ubuntu system if you ever need to do so.

Open your Ubuntu Terminal and move to the directory where XAMPP is installed. That is:

```
$ cd /opt/lampp
```

The next step is to run the uninstall program you will find in the lampp folder through the following command:

```
$ sudo ./uninstall
```

The following dialog will appear asking you if you want to uninstall XAMPP and all of its modules:

Click *Yes* to proceed with the uninstall process.

You will get the following message after successful uninstallation of XAMPP.

Click *OK*.

Another important step is to manually remove the lampp folder along with all its files

and sub-folders. The following command will help you in doing so:

```
$ sudo rm -r /opt/lampp
```

Now, XAMPP and all its modules are out of your system. You can also delete the downloaded install package if you want.

In this tutorial, you have learned a step-by-step installation process for XAMPP on your

Ubuntu System. From downloading the install package, running it, and then verifying the installation, you have walked through the entire procedure with us. We have also provided enough information about uninstalling XAMPP if you ever need to do that.
